**PREPARATION**

Prepare the surface by wetting the area to be repaired. This will prevent the concrete from absorbing the water from the Fast Setting Cement Patcher.

**APPLICATION**

Enhance bonding can be achieved by mixing the material to a wet consistency (slurry coat).

Place some of the material, by hand, on the damaged area.

** BE SURE TO WEAR GLOVES **
Add additional product to the mix to create a thick consistency before making the repair.

FINISHING

Place the material on the damaged area using a margin trowel. As it begins to stiffen, shape the material to form the corner.

Complete the repair by using a brush to smooth any existing seams and blend the repaired area into the existing concrete.
