PREPARATION

Remove all unsound concrete and any other foreign materials that will inhibit performance.

The surface should be brought to a saturated surface dry condition (SSD).

MIXING

Mix Anchor Cement according to the directions on the container.

This is a rapid setting product. Do not mix more material than can be placed in 10 minutes.

If mixing less than a full container, mix 4 parts Anchor Cement with 1 part water.

APPLICATION

In this application, the original installation left an area lacking material. This space needs to be filled completely to avoid water pooling around the rail. Water pooling can lead to the rail rusting unnecessarily.

Once mixed, pour the product into the hole, filling it completely. Overfill the hole slightly.

As the Anchor Cement stiffens, gently slope the material so water moves away from the patch and the railing.

Anchor Cement will set in 30 minutes.

NOTE: For new installations of railings it is important to refer to product data sheet for additional instructions.
