PREPARATION

Remove all loose and broken pieces of concrete out and away from the crack.

Sweep the repair area. This will eliminate any dust and small items in and around the crack perimeter.

APPLICATION

Always wear gloves when using polyurethane-based repair material.

Cut the tip of the tube to the appropriate size needed to fill the crack. Place the tube of Self Leveling Sealant into a caulk gun.

Begin filling the crack with Sakrete Self Leveling Sealant.

When repairing deep cracks it may be necessary to re-apply the Self Leveling Sealant multiple times.

Some deep crack repairs may continue to level overnight. Re-apply the Self Leveling Sealant as needed to complete the repair.

The Self Leveling Sealant will feel tacky up to 24 hours after application. Deep cracks that require more material may have a longer set time.

The Self Leveling material will remain flexible once set. This is designed to allow for flexibility in the repair area as the surrounding concrete moves with expansion and contraction.
